```
messenger RNAs that populate a (sub-)transcriptome, where the (sub-
ltranscriptome comprises messenger RNAs transcribed from multiple
transcription units that populate a genome. The library comprises several
oligonucleotides, each capable of hybridising selectively to a set of
messenger RNAs transcribed from a given transcription unit of the genome,
which encodes one or more messenger RNA splice variants. The
oligonucleotide libraries are useful for detecting mRNAs from a
biological sample, in expression profiling studies, in qualitatively or
comparatively characterising the corresponding transcriptom, and in
detecting RNA transcripts and splice variants of human or animal
transcriptomes. The libraries may also be used as specialised mini
control of the libraries may also be used as specialised mini
therefore the detect transcripts of a sub-transcriptome under a particular
biological or pathological state, and so allowing the detection of tissue
control of the princip genes; and to detect RNA transcriptom of the
specific tissue under a specific pathological condition; to detect
developmental specific genes; and to detect RNA transcripts
compared to a transcriptome of a parient suffering from a particular
disorder. ABN27253 to ABN59589 represent oligonuclectide sequences from
rates, humans and mice, which are used in the exemplification of the
present invention. N.B. The sequence data for this patent did not form
part of the printed specification, but was obtained in electronic format
directly from WIPO at ftp.wipo.int/pub/published_pot_sequences

The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (XPNBP2), bradykinin receptor B1 (MACR1), C1 estrease inhibitor C (INRH), kallikrein Cachykinin receptor B2 (TACR1), C1 estrease inhibitor (CINRH), kallikrein C1 (XIKI), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme C2 (ACE2) or protease inhibitor 4 (P14), comprising at least one C2 polymorphic position as provided in the detailed summary of single cC polymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additional 5' and 3' flanking genomic C3 (ACE2) analyshing (M1) at least one nucleic acid sample comprising concerning the sample from one or more individuals and determining the nucleic acid sequence at one or more polymorphic positions in a gene concoling a protein selected from the group above; (3) constructing (M2) contraining the genes comprising grouping at least two nucleic acids end from the group above; (4) constructing (M2) contraining the polymorphic data; (5) a library of nucleic acids, each of which comprises one or more polymorphic positions within a gene encoding a comprise one or more polymorphic positions within a gene encoding a comprising obtaining a nucleic acid sample, determining the nucleotide present in at least one polymorphic position, and (6) genotyphing (M4) and cindividual comprising obtaining a nucleic acid sample, determining the contraint avarious disorders such as angloedaema and diseases which contain various disorders such as angloedaema and diseases witch hypertension, heart failure, myocardial infarction, ventricular corronary artery diseases, aneurysm, embolism, theorems, cronnary artery diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence represents or contains the region surrounding a single-nucleotide polymorphism in one of the genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in specification). The polynucleotides are also useful for chromosome identification. Antibodies

New isolated nucleic acid with at least one polymorphic position, useful for detecting, diagnosing and treating disorders such as angioedema, cancer, viral, bacterial or fungal infection, cardiovascular and cancer, viral, bactautoimmune diseases

Claim 3; Page 795; 977pp; English.

The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (EDKRB1), clesterase inhibitor (CIMB1), kallikrein tachykinin receptor B1 (EDKRB2), angiotensin converting enzyme (CIMCM2), bradykinin receptor B2 (EDKRB2), angiotensin converting enzyme polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additional 5 and 3 flanking genomic equence; (2) analyping (M1) at least one nucleic acid sample comprising obtaining the sample from one or more polymorphic positions in a gene confirm selected from the group above; (3) constructing (M2) andletic acid sequence at one or more polymorphic positions in a gene confirmation by a protein selected from the group above; (3) constructing (M2) andletic acid sequence at one or more polymorphic positions within a gene encoding a upon administration of an ACE inhibitor and/or vasopeptidase inhibitor upon administration of an ACE inhibitor and/or vasopeptidase inhibitor comprises one or more polymorphic positions within a gene encoding a comprises one or more polymorphic position, and comparing at individual comprising obtaining a nucleic acid sample, determining the nucleotide present in at least one polymorphic position, and comparing at cleast one position with a known date set. The genes, (M1, M2, M3 and M4) and composition with a known date set. The genes, (M1, M2, M3 and composition with a known date set. The genes, (M1, M2, M3 and composition with a known date set. The genes, (M1, M2, M3 and composition with a known date set. The genes, (M1, M2, M3 and CC involve angiogenesis like haemangiones like angina pectoris, hypertrophy, vascular diseases, and cardiovascular diseases, atteriosclerosis and/or atteriosclerosis and/or atteriosclerosis and/or atteriosclerosis and/or atteriosclerosis and diseases, and diseases, atteriosclerosis and encencolitic destructive pulmonary diseases and disea

The products of the isolated clone can be used in research, detection and therapy, as they may have nutritional activity, cytokine and cell proliferation/differentiation activity. A search against the Genbank database demonstrated at least some homology with pig vasolin-containing protein (VCP) mRNA
polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence represents or contains the region surrounding a single- nucleotide polymorphism in one of the genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Poly:nucleotide(s) and proteins obtained from human PBMC, dendritic cell, adult brain, foetal brain and adult testes cDNA libraries - used in research, detection and therapy of, e.g. cytokine and cell proliferation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AU47 8 protein; human adult testes cDNA library; nutritional activity; cytokine activity; cell proliferation/differentiation activity; probe; homology; pig vasolin-containing protein; VCP mRNA; hybridisation; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present PCR primer was used to amplify cDNA encoding a human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 CDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure
                                                                                                                                         Human; angiotensin converting enzyme-2; ACE-2; angiotensin I; Ang. The present sequence is a gene specific primer designed starting about 400 bp downstream of the 5' end of the 1.6 kb human angiotensin converting enzyme-2 (ACE-2) clone. This sequence is used in 5' RACE (rapid amplification of cDNA ends) for cloning and analysis of human ACE-2. ACE is also referred as peptidally dipeptidase A. Nucleic acid sequence encoding ACE-2 is useful as antisense or antigene agents for sequence of pair mulations in the gene. Nucleic acid sequence pair mutations in the gene. Nucleic acid sequence encoding ACE-2 is useful in the rapeutics, diagnostics and in screening assays. ACE-2 antagonist is used to treat hypertension or congestive heart failure (CHF). ACE agonist is used to reduce the inflammation and pain resulting from an insect sting or bite, which was accompanied by an injection of bradykinin. Anti-ACE-2 antibodies are used to monitor ACE-2 protein abservant and accompanied by an insection of abservant and accompanied by an insection of abservant and accompanied by an insection of abservant accompanied by an insection of abservant and accompanied by an insection of abservant accompanies or condition associated with an accompanies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel genes encoding angiotensin converting enzyme-2 useful as antisense or antigene agents for therapeutics, diagnostics and screening assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; angiotensin converting enzyme-2; ACE-2; therapy; hypertension; peptidyl dipeptidase A; blood pressure; hypotension; atherosclerosis; mycoardial infarction; heart failure; arrhythmia; renal failure; inflammation; fertility; enzyme; exon 18; ds.

The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polymucleotides. ACE-2 is also known as peptidyl dispeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, acute heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is rapid amplification of cDNA ends (RACE) primer used Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or 0.8%; Score 27; DB 1; Length 27; 00.0%; Pred. AAA12740-41 represent nucleotide sequences containing a G to T polymorphism in 3' UTR of human angiotensin converting enzyme-2 (ACE-2). AAA12741 represents the variant sequence, with position 13 representing the polymorphism. ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. [1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, angiotensin converting enzyme-2, ACE-2; angiotensin I; Ang.(1-9); blood pressure; hypertension; congestive heart failure; atherosclerosis; chronic heart failure; acute heart failure; myocardial infarction; renal failure; PCR primer; ss.

dipeptidase A (BC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, conferning heart failure, acute heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynuclectides. ACE-2 is also known as peptidyl dipeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. WO200212471-A2 Homo sapiens 18-JUN-2002 14-FEB-2002 variation AAD32652; 8셤 ö PCR primers AAA12742-43 were used for chromosome localisation of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 CDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure Isolated nucleic acid encoding angiotensin converting enzyme-2 (ACE-2) polypeptide useful for detecting an ACE-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction, Human, angiotensin converting enzyme-2; ACE-2; therapy; hypertension; peptidyl dipeptidase A; blood pressure; hypotension; atherosclerosis; myocardial infarction; heart failure; arrhythmia; renal failure; inflammation; fertility; enzyme; PCR; primer; ss. ACE-2 is also known as peptidyl dispeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is human ACE-2 DNA fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                     Human, angiotensin converting enzyme-2; ACE-2; therapy, hypertension, peptidyl dipeptidase A, blood pressure, hypotension, atherosclerosis; myocardial infarction, heart failure, arrhythmia; renal failure,

least one position with a known data set. The genes, (M1, M2, M3 and M4)

and compositions are useful for detecting, diagnosing, treating,
preventing various disorders such as anglecdaem and diseases which
involve anglogenesis like haemangiomas, tumours, sarcomas, Crohn's
disease, trachomas, and cardiovascular diseases like angina pectoris,
bypertrophy, wascular diseases, aneurysm, embolism, thrombosis, coronary
artery disease, arteriosclerosis and/or atherosclerosis, and
hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory
arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic
obstructive pulmonary disease (COPD) and enterocolitis (many other
cliseases and disorders are listed in the specification). The
polynucleotides are also useful for chromosome identification. Antibodies
addinst the proteins may be utilised for immunophenotyping of call lines
for the control amples. The present sequence is a genotyping PCR primer
for the control of a supplex of the control for the gene encoding one of the proteins listed above

The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (XPNBP2), bradykinin receptor B1 (BDKRB1), cleaterase inhibitor, (CINB), kallikrein tacohykinin receptor B1 (BDKRB2), angiotensin converting enzyme (CC (ACE2) or protease inhibitor 4 (P14), comprising at least one or protease inhibitor 4 (P14), comprising at least one or protease inhibitor and or provided in the detailed summary of single complymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additional s' and 3' flanking genomic sequence; (2) analytying (M1) at least one nucleic acid sample comprising containing the sample from one or more polymorphic positions in a gene nucleic acid sequence at one or more polymorphic positions in a gene nucleic acid sequence at one or more polymorphic positions in a gene nucleic acid sequence at one or more polymorphic positions in a gene nucleic acid sequence at one or more polymorphic positions in a gene nucleic acids, each of which an entire polymorphic data; (5) a library of nucleic acids, each of which comprises one or more polymorphic positions within a gene encoding a nucleotide present in at least one polymorphic position, and comparing (M4) and compositions are useful for detecting, diagnosing, treating, and compositions are useful for detecting, diagnosing, treating, preventing various disorders such as angiocedaema and diseases which in compositions are useful for detecting, diagnosing, treating, by pretrophy, vascular diseases, and cardiovascular diseases like angina pectoris, hypertrophy, vascular diseases, and compositions, heart failure, myocardial infarction, ventricular disease, arteriosers such as angiocedaema and diseases, and hypertrophy, vascular disease, and compositions, heart failure, myocardial infarction, ventricular disease, arteriosers such as angiocedaema and diseases, and hypertrophy, vascular disease, and encoded and diseases, arteriosers sequence detecting at the province of arteriosers and or sequence polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is a genotyping PCR primer for the gene encoding one of the proteins listed above, using the method New isolated nucleic acid with at least one polymorphic position, useful for detecting, diagnosing and treating disorders such as angioedema, cancer, viral, bacterial or fungal infection, cardiovascular and of automated genetic bit analysis, GBA Example 3; Page 936; 977pp; English autoimmune diseases.

                                                                                                                                                                                                                                                                                           The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynucleotides. ACE-2 is also known as peptidyl dispeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, acute heart failure, mycoardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is human ACE-2 exon 18 fragment polymorphic variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; angiotensin converting enzyme-2; ACE-2; angiotensin I; Ang. (1-9); blood pressure; hypertension; congestive heart failure; atherosclerosis; chronic heart failure; acute heart failure; myocardial infarction;
                                                                                                                                                                                                              Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal bloc pressure or related diseases, e.g. hypertension, heart failure or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

polymorphism (SSCP) analysis of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA ilbrary pragraed from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, angiotensin converting enzyme-2; ACE-2; angiotensin I; Ang. (ACE-2) ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 CDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat blood pressure related disease and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, angiotensin converting enzyme-2; ACE-2; angiotensin I; Ang.(1-9); blood pressure, hypertension; congestive heart failure; atherosclerosis; chronic heart failure; acute heart failure; myocardial infarction; renal failure; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated nucleic acid encoding angiotensin converting enzyme-2 (ACE-2) polypeptide useful for detecting an ACE-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction, atherosclerosis and renal failure.
PCR primers AAA12766-A12821 were used for single strand conformation polymorphism (SSCP) analysis of human angiotensin converting enzyme-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR primer ace2e7b used in SSCP analysis of human ACE-2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PCR primers AAA12766-A12821 were used for single strand conformation polymorphism (SSCP) analysis of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 CDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated nucleic acid encoding angiotensin converting enzyme-2 (ACE-2) polypeptide useful for detecting an ACB-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction, atherosclerosis and renal failure.

ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure

The peptide is used to raise antibodies. ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and

primer ace2e18f used in SSCP analysis of human ACE-2. AAA12817 standard; DNA; Query Match Matches PCR 8 d

Isolated nucleic acid encoding angiotensin converting enzyme-2 (AC) polypeptide useful for detecting an ACE-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction, atherosclerosis and renal failure. Example; Page 106; 138pp; English. Hsieh FY; (MILL-) MILLENNIUM PHARM INC Robison KE, WPI; 2000-293140/25 Acton LS,

PCR primers AAA12766-A12821 were used for single strand conformation polymorphism (SSCP) analysis of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang (1-9). The ACE-2 therapeutics are used to treat beload pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure Sequence 25 BP; 5 A; 7 C; 4 G; 9 T; 0 U; 0 Other; 0.78;

Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or myocardial infarction.

Example 10; Page 115; 218pp; English.

for polypeptides and polymoclectides. ACE-2 is also known as peptidy! dispetidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, acute heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation The invention relates to human angiotensin converting enzyme-2 (ACE-2)

                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynucleotides. ACE-2 is also known as peptidyl dispetidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, enrocated and infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          blood

polypeptides and polymuclectides. ACE-2 is also known as peptidyl dipeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, myocardial infarction, atherosclerosis, arhypthmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation polymorphism (SSCP) analysis of human ACE-2 DNA
                                                                                                                                                                                                                                                                                                                                              Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human angiotensin converting enzyme-2 (ACE-2)
peptidyl dipeptidase A, blood pressure, hypotension, atherosclerosis, myocardial infarction, heart failure, arrhythmia, renal failure, inflammation, fertility, enzyme, PCR, primer, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, angiotensin converting enzyme-2, ACE-2; therapy, hypertension, peptidyl dipeptidase A; blood pressure, hypotension, atherosclerosis, myocardial infarction, heart failure, arrhythmia, renal failure,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0.7%; Score 25; DB 1; Length 25; 100.0%; Pred. The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynucleotides. ACE-2 is also known as peptidyl dispeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polypeptides and polynuclectides. ACE-2 is also known as peptidyl dispetidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, arcute heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The
                                                      The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynuclectides. ACE-2 is also known as peptidyl dispeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, enroise heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (ACE-2)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polymuclectides. ACE-2 is also known as peptidyl dipeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation polymorphism (SSCP) analysis of human ACE-2 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               peptidyl dipeptidase A, blood pressure; hypotension; atherosclerosis; myocardial infarction; heart failure; arrhythmia; renal failure; inflammation; fertility; enzyme; PCR; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAA12740-41 represent nucleotide sequences containing a G to T polymorphism in 3' UTR of human angiotensin converting enzyme-2 (ACE-2). AAA12741 represents the variant sequence, with position 13 representing the polymorphism. ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 CDNA was determined from a clone obtained from a CDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure
                                                                                                                                           Human; angiotensin converting enzyme-2; ACE-2; angiotensin 1; Ang. (1-9); blood pressure; hypertension; congestive heart failure; atherosclerosis; chronic heart failure; acute heart failure; myocardial infarction;
                                                                                                                                                                                                                                                                                                                                                                                                  Isolated nucleic acid encoding angiotensin converting enzyme-2 (ACE-2) polypeptide useful for detecting an ACE-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction, atherosclerosis and renal failure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

ACE-2 is also known as peptidyl dipeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is human ACE-2 DNA fragment polymorphic variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human angiotensin converting enzyme-2 (ACE-2)
Human; angiotensin converting enzyme-2; ACB-2; therapy; hypertension; peptidyl dipeptidase A; blood pressure; hypotension; atherosclerosis; mycoardial infarction; heart failure; arrhythmia; renal failure; inflammation; fertility; enzyme; polymorphism; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, angiotensin converting enzyme-2; ACE-2; therapy, hypertension, peptidyl dipeptidase A; blood pressure; hypotension, atherosclerosis, myocardial infarction, heart failure, arrhythmia, renal failure; inflammation, fertility; enzyme; exon 18; polymorphism; de.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal bloo pressure or related diseases, e.g. hypertension, heart failure or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

PCR primers AAA12766-A12821 were used for single strand conformation polymorphism (SSCP) analysis of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a numbject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; angiotensin converting enzyme-2; ACE-2; angiotensin I; Ang. (1-9); blood pressure; hypertension; congestive heart failure; atherosclerosis; chronic heart failure; acute heart failure; myocardial infarction;
                                                                                      Isolated nucleic acid encoding angiotensin converting enzyme-2 (ACE-2) polypeptide useful for detecting an ACE-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction, atherosclerosis and renal failure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acid encoding angiotensin converting enzyme-2 (ACE-2) polypeptide useful for detecting an ACE-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction, atherosclerosis and renal failure.

ACE-2 is also known as peptidyl dispeptides A (E. 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, acute heart failure, and atherosclerosis, arhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The
